

Shrishail C.H

Manager

PROFILE SUMMARY

With over 13 years of experience in Quality Assurance, I specialize in test automation, framework development, and data validation. I am highly skilled in Selenium with Python, Robot Framework, Playwright, and have a basic understanding of BDD (Behave) frameworks, enabling me to design efficient, reusable automation solutions. My expertise in API testing with Pytest ensures robust, scalable services, while my knowledge of CI/CD practices, Git, and version control integrates testing into seamless pipelines for continuous delivery. Experienced with test management tools like JIRA and ADO, I effectively track defects, prioritize tasks, and optimize workflows. Additionally, I leverage ETL processes, MongoDB, and Airflow for thorough data validation, ensuring data integrity throughout testing cycles. My holistic approach to testing, combining automation, data validation, and process integration, guarantees high-quality and reliable software delivery across projects.

EDUCATION

2011

B.Tech/B.E.

Visveswaraiah Technological University (VTU)

WORK EXPERIENCE

Oct 2022 - Aug 2024

Senior Automation Specialist

Andortech - Shell Client Project

- Understand requirements and functional specifications; create detailed test cases, including Anaplan model validation scenarios.
- Review and refine test case/test scenario documents to ensure coverage for Anaplan-based financial models, forecasting, and scenario analysis.
- Execute test cases to validate functional behaviors of the application, including data integrations between Anaplan and external systems.
- Execute test scripts on Internet Explorer for compatibility testing and ensure Anaplan UI functionalities work seamlessly across browsers.
- Participate in meetings with PM, Dev, and QE team members to gather requirements before writing test cases for Anaplan workflows and financial automation.
- Write and execute automation test scripts using WebDriver for functional and regression testing (Robot Framework), incorporating Anaplan model testing.
- Implement Python automation for real-time Anaplan model validation, ensuring correct data processing and

Technical Lead

Uthunga Technologies - ABB Client Project

- Requirement Gathering: Collaborated with stakeholders to understand the requirements for industrial automation projects and define the scope of tasks.
- Task Splitting: Analyzed requirements and broke them down into smaller, manageable tasks, ensuring proper distribution based on the devices and their functionalities.
- Team Management: Led a team of engineers, providing guidance, support, and ensuring timely delivery of tasks while maintaining quality standards.
- Simulation Development: Utilized Python 2.x/3.x to develop and integrate simulation modules, ensuring that the simulated devices performed as expected in the testing environment.
- Mako Template Usage: Leveraged Mako templating to dynamically generate simulation files, optimizing the process of creating test scenarios for the devices.
- Cross-Functional Collaboration: Worked closely with other teams, such as hardware and testing teams, to ensure the smooth integration of software simulations with real-world devices.
- Code Conversion: Managed the conversion and compatibility of Python modules across versions (Python 2.x to 3.x) to ensure smooth operation in the project environment.
- Performed Big Data testing using tools like Apache Hadoop, to validate data processing, integrity, and performance across distributed systems
- Mentoring and Knowledge Sharing: Provided mentoring to junior team members, sharing technical expertise and fostering a collaborative environment for continuous learning.
- Validating big data in Hadoop involves verifying the accuracy, completeness, and consistency of large datasets processed and stored across distributed systems, ensuring that data transformations, aggregations, and analyses are performed correctly within the Hadoop environmen

May 2020 - Nov 2020

Technical Lead

Velankani Communications Technologies - Cisco Client project

- Requirement Analysis: Collaborated with stakeholders to understand functional specifications and gather requirements for UI automation.
- Automation Script Development: Led the development and execution of automation scripts using Robot Framework for functional and regression testing.
- Test Execution and Reporting: Oversaw the execution of test cases using pytest and Robot Framework, ensuring

Apr 2019 - Dec 2019

accurate reporting and bug tracking.

- Cross-Team Coordination: Facilitated communication between development, quality engineering (QE), and project management (PM) teams to ensure alignment on test requirements.

Technical Lead

Wipro - Verifone Client Project

- OS Transition Support: Worked on transitioning Verifone's payment devices from the existing operating system to Android OS, ensuring compatibility and functionality.
- Device Functionality Testing: Tested the functionality of payment devices running Android OS, validating the seamless operation of contact and contactless card payments.
- Test Automation: Developed and executed automation scripts using Python within the proprietary WATTS 360 and specflow framework to validate device functionality and performance.
- Framework Utilization: Leveraged WATTS 360 framework to simulate real-world payment scenarios, ensuring reliable test coverage and accurate results.
- Issue Identification and Resolution: Identified, tracked, and resolved issues related to Android OS integration, ensuring that payment devices functioned as expected.
- Collaborative Testing: Worked with cross-functional teams to gather requirements, perform tests, and ensure the devices met both technical specifications and business requirements.
- Integration Testing: Conducted integration testing to verify communication between the Android OS and the payment device hardware, ensuring all components worked together seamlessly.
- Documentation: Documented test results, created detailed bug reports, and maintained test case repositories for future reference and compliance.

Aug 2011 - Jul 2018

Senior Software Engineer

Mindtree - SouthWest Airlines Client Project

- Manual Testing (Initial Career): Started career as a Manual Tester, working on the airline ticket booking application, ensuring the application met functional and business requirements.
- Requirement Understanding: Collaborated with cross-functional teams (PM, Dev, QA) to gather and understand project requirements, application flow, and testing scope.
- Test Case and Scenario Creation: Analyzed requirements to create detailed test scenarios and test cases for functional, integration, and regression testing of the airline booking system.
- Test Execution and Reporting: Executed manual test cases to validate features, logged defects, and tracked issues to closure, ensuring quality and reliability of the application.
- Transition to Automation Testing: Transitioned from Manual to Automation testing, learning and implementing

- Python for web application test automation.
- Automation Script Development: Automated previously written test cases using Python and Selenium, improving the efficiency and coverage of the testing process.
- Continuous Learning and Skill Development: Actively learned automation frameworks and tools, keeping up to date with industry trends to enhance testing methodologies.
- Collaborative Testing: Worked closely with the development team to identify test requirements, discuss testing progress, and refine test cases and scripts for automated testing.
- Regression Testing: Implemented automation for regression testing, significantly reducing manual effort and ensuring stable functionality after code updates.
- Test Reporting and Metrics: Generated automated test reports and metrics to provide detailed insights into test execution and quality of the application.

Nov 2024 -
Present

Manager

Quinnox - Chetwood

- Acted as an individual contributor for Python automation in the Savings domain.
- Gathered and analyzed testing requirements from the client to ensure comprehensive coverage.
- Designed and documented test cases and test scenarios based on functional and business requirements.
- Conducted test case reviews with the client to validate coverage and accuracy.
- Developed and executed automated test scripts using Python automation frameworks.
- Created automation for API testing and UI testing using Playwright.
- Implemented test automation frameworks to enhance efficiency and reduce manual effort.
- Worked with AWS services such as CloudWatch, DynamoDB, and S3 Bucket for cloud-based testing and monitoring.

Projects

16 Months

FIS EPM

The Retail Position Management platform enables the Portfolio Management team to oversee portfolio risk, support hedging strategies, and track financial and physical positions at the customer and portfolio levels. It integrates

real-time demand forecasts, market prices, customer pricing formulas, and trades from ETRM systems to enhance decision-making. Anaplan was implemented to automate financial forecasting, Mark-to-Market (MtM) calculations, and P&L analysis, reducing manual effort and improving risk visibility. Python-based automation ensured seamless data integration between Anaplan, Azure Blob Storage, and ETRM systems. Additionally, microservices with Pymongo validated data accuracy across systems. By automating risk assessments and financial reporting, the platform enhanced portfolio monitoring, hedging strategies, and real-time exposure management, optimizing financial operations and reducing reporting time by 50%.

6 Months

CuBE

CUBE is an innovative web-based platform that enables users to create models and simulations for complex energy commercial transactions. It computes the value, risks, and trade-offs of deferment scenarios, providing deep insights into transaction dynamics. I contributed to its efficiency by working on API automation and Anaplan integration, enhancing its ability to handle complex data interactions seamlessly. Anaplan was implemented for financial modeling, scenario analysis, and P&L forecasting, ensuring real-time insights for decision-making. Python-based automation ensured correct data flow between Anaplan, CRM systems, and reporting tools, improving overall efficiency. Technologies used include Python, Playwright, Pickle for model handling, Git for version control, Azure DevOps (ADO) for CI/CD, Microservices, and API testing. This approach ensures CUBE delivers reliable, accurate financial insights with automated risk assessments and streamlined reporting.

20 Months

FFT Conversion

ABB is an industrial automation company that specializes in delivering advanced solutions for monitoring liquid flow and continuously measuring liquid temperature for its clients. This project focuses on establishing seamless communication with external devices through Profibus and ProfiNet protocols, enhancing the efficiency of industrial automation systems. Technologies used in the project include Generative AI, AI model validation, **Git** for version control, **MAKO** templates for dynamic web rendering, and programming languages such as **SQL**, **Python** and **C#**. Rendering engines are also utilized to improve the visualization and processing of data. The integration of these technologies ensures optimized performance and reliable operation in industrial environments, helping ABB deliver cutting-edge solutions to its clients.

8 Months

Verifone

I was involved in automating Verifone devices, specifically focusing on contact and contactless card validation, as they transitioned from Verifone OS to Android. My role included validating these devices using a Python-based framework.

The product line includes POS payment devices with proprietary operating systems, security software, and certified payment solutions, designed for both consumer-facing and unattended environments. We leveraged Git for version control, **Jenkins** for CI/CD, and API testing frameworks like Pytest. Additionally, **Robot Framework**, **BDD**, and **Pytest** were used to ensure functionality, security, and performance, ensuring the delivery of high-quality, secure payment solutions during this transition

72 Months

SouthWest Airlines

The air ticket booking web application supports various categories, including youth, disabled, check-in, boarding, deboarding, and re-accommodation, as well as different flight types like local on, local off, through, and **ETOPS** flights. Automated testing is performed using Selenium with Java and Python, while API validation is carried out with the requests module. **API** testing is enhanced with Postman, Pytest, and the Robot Framework. Load testing is done using Locust, and project management, along with **CI/CD** integration, is handled through Azure DevOps (ADO). Version control is managed via **Git**, ensuring efficient and streamlined development and testing processes. Technologies used include **Selenium**, **Robot Framework**, **SpecFlow**, **Pytest**, and **Postman**

3 Months

Chetwood

Chetwood Financial is a UK-based digital bank specializing in savings accounts, loans, and credit products. It focuses on providing innovative financial solutions using technology and automation to enhance customer experience and operational efficiency. The bank leverages data-driven insights to develop flexible products tailored for underserved customer segments.

Project Description:

Worked on the Savings domain at Chetwood Bank, specifically on the Refund Rejection Notification process for closed accounts. The project aimed to automate the identification, validation, and notification workflow, ensuring customers receive accurate and timely updates when refunds fail due to account closure
